

MAROTTE CARVED PANELS INSTALLATION GUIDE LINE

Storage and handling

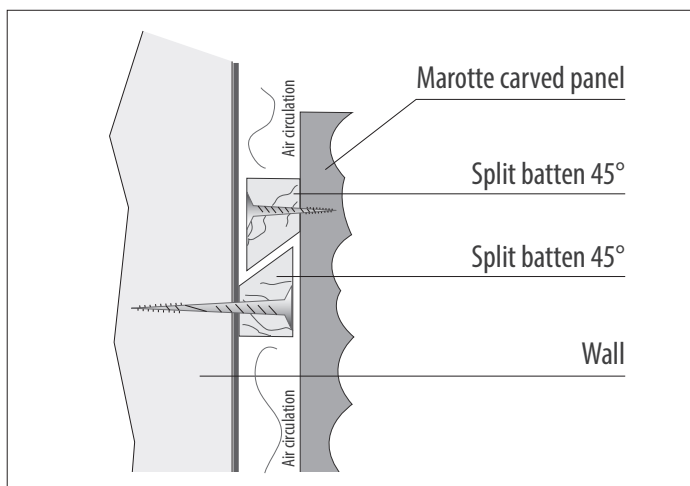

Flat storage is the best. It is recommended to store the panels in an atmospherically stabilized room to avoid extrem fluctuations of humidity. Prior to installation, the panels must be stabilized to ambient conditions. Store them for at list 48 hours in a flat position in the place where they will be installed.

Installation

We recommend to install the panels with split battens runing horizontally every ± 50 cm - see sketch below. We also recommend to leave a void between panels and the wall in order to allow air to circulate.
